

## 12. Labelling

Sheddit! requires that labels on containers adequately and accurately display the contents of the container.

If smaller amounts are transferred from the main container to a smaller one, then proper care needs to be taken when using / disposing of the smaller / work containers because harm could result otherwise.

For example, a plastic water bottle filled with mineral turpentine would poison and possibly kill a drinker who mistook the contents for water.

All chemical liquids should carry a proper identification label. This may be made using 'dymo labelling' if required.
